# True Delivery Model

- builds and releases software versions
- publishes release channels
- ensures the release and the publication security via verifying the minimal number of valid GPG signatures associated with an action
- ensures the object storage security via saving data signed by keys (no one has access to those keys) and continuously rotating TUF keys and metadata

- manages software repositories
- updates software version within the selected release channel
- provides easy operation with software version artifacts in the shell session
- ensures safe communication via working with the TUF repository in a reliable fashion
